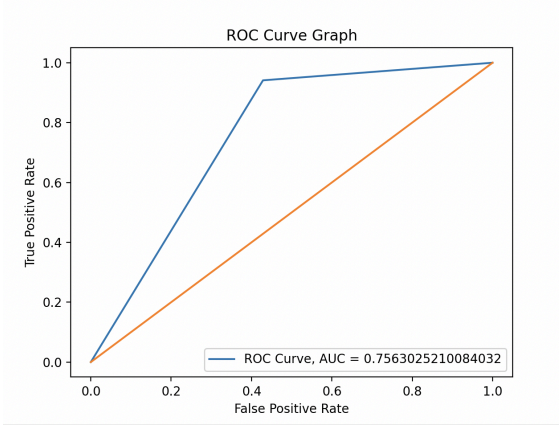
Final Model Decisions

- Selected Model: Logistic Regression
- Reason: Logistic Regression model had the highest accuracy, 77.4%. The Logistic Regression model also had a high ROC-AUC curve score. Below is the Confusion Matrix, alongside the ROC-AUC curve.
- Overview: The end goal of this model is to do binary classification, but evaluating the model with ROC-AUC.
- 



Front-end Inputs

- Forecasted Weather; a string; Rain, Cold, Warm, Clear Skies.
- Mood Level Before Going Out (Throughout the Day); a string; Stressed, Sad, Neutral, Relaxed, Happy.
- Energy Level Before Going Out (Throughout the Day); a string; Exhausted, Low Energy, Neutral, Energized, Extremely Energized.
- Responsibility Level Before Going Out (Throughout the Day); a string; Low (No deadlines in the next week), Medium (Deadlines in the next week), High (Deadlines in the next 3 days).

Front-end Request

- {
  “Forecasted_weather”: “Clear Skies”,
  “mood_level”: “Happy”,
  “energy_level”: “Energized”,
  “responsibility_level”: "Low (No deadlines in the next week)"
  }
